

## Features

- Automatic power-down when deselected (7C168A)
- CMOS for optimum speed/power
- High speed
  - $t_{AA} = 15$  ns
  - $t_{ACE} = 10$  ns (7C169A)
- Low active power
  - 385 mW
- Low standby power (7C168A)
  - 83 mW
- TTL-compatible inputs and outputs
- $V_{IH}$  of 2.2V
- Capable of withstanding greater than 2001V electrostatic discharge

## Functional Description

The CY7C168A and CY7C169A are high-performance CMOS static RAMs organized as 4096 by 4 bits. Easy memory expansion is provided by an active LOW chip enable ( $\overline{CE}$ ) and three-state drivers. The CY7C168A has an automatic power-down feature, reducing the power consumption by 77% when deselected.

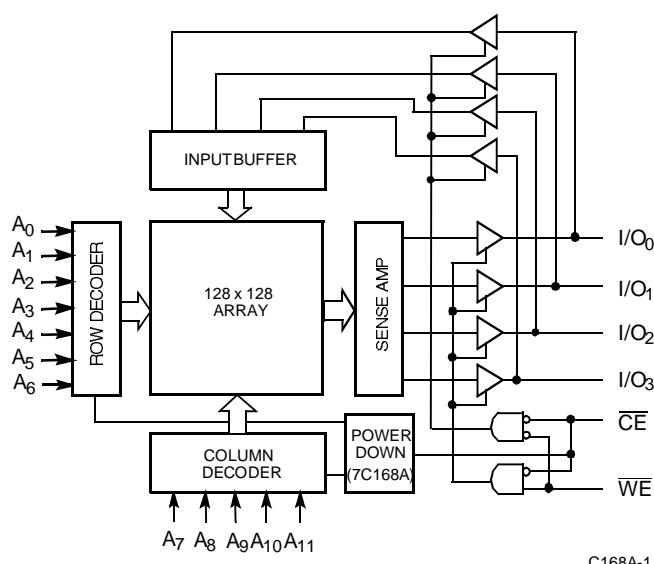

Writing to the device is accomplished when the chip select ( $\overline{CE}$ ) and write enable ( $\overline{WE}$ ) inputs are both LOW. Data on the four data input/output pins ( $I/O_0$  through  $I/O_3$ ) is written into the memory location specified on the address pins ( $A_0$  through  $A_{11}$ ).

Reading the device is accomplished by taking the chip enable ( $\overline{CE}$ ) LOW, while ( $\overline{WE}$ ) remains HIGH. Under these conditions, the contents of the location specified on the address pins will appear on the four data input/output pins ( $I/O_0$  through  $I/O_3$ ).

The input/output pins remain in a high-impedance state when chip enable is HIGH or write enable ( $\overline{WE}$ ) is LOW.

A die coat is used to insure alpha immunity.

## Maximum Ratings

(Above which the useful life may be impaired. For user guidelines, not tested.)

Storage Temperature ..... $-65^{\circ}\text{C}$  to  $+150^{\circ}\text{C}$

Ambient Temperature with

Power Applied..... $-55^{\circ}\text{C}$  to  $+125^{\circ}\text{C}$

Supply Voltage to Ground Potential

(Pin 20 to Pin 10)..... $-0.5\text{V}$  to  $+7.0\text{V}$

DC Voltage Applied to Outputs

in High Z State ..... $-0.5\text{V}$  to  $+7.0\text{V}$

DC Input Voltage ..... $-3.0\text{V}$  to  $+7.0\text{V}$

Output Current into Outputs (Low) ..... 20 mA

Static Discharge Voltage .....  $>2001\text{V}$   
(per MIL-STD-883, Method 3015)

Latch-Up Current .....  $>200\text{ mA}$

## Operating Range

| Range                   | Ambient Temperature                             | $V_{CC}$             |
|-------------------------|---|----------------------|
| Commercial              | $0^{\circ}\text{C}$ to $+70^{\circ}\text{C}$    | $5\text{V} \pm 10\%$ |
| Military <sup>[1]</sup> | $-55^{\circ}\text{C}$ to $+125^{\circ}\text{C}$ | $5\text{V} \pm 10\%$ |

### Notes:

- $T_A$  is the "instant on" case temperature.
- See the last page of this specification for Group A subgroup testing information.
- $V_{IL}$  min. =  $-3.0\text{V}$  for pulse durations less than 30 ns.
- Not more than 1 output should be shorted at one time. Duration of the short circuit should not exceed 30 seconds.

**Switching Waveforms**
**Read Cycle No. 1**<sup>[11,12]</sup>

C168A-5

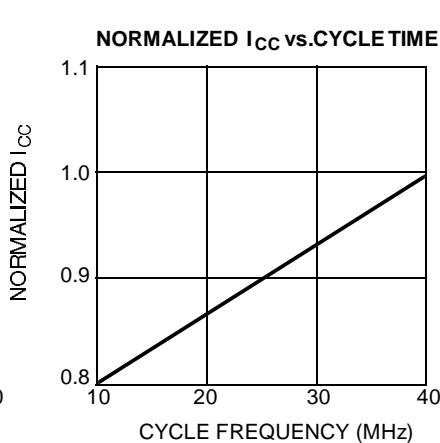

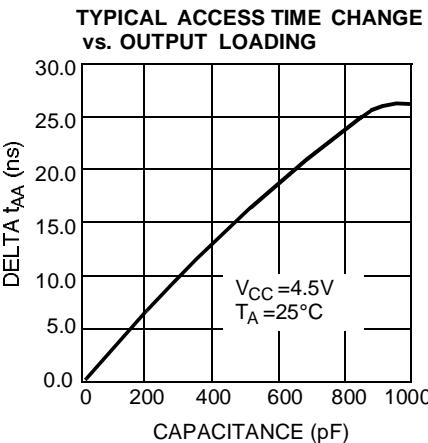

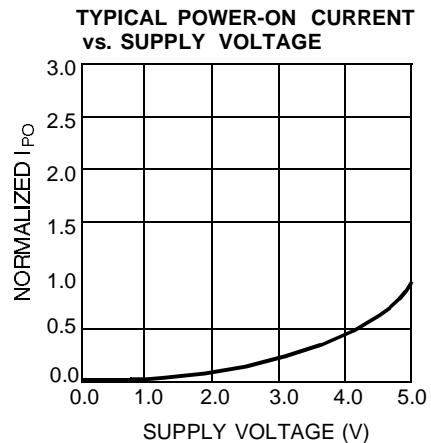

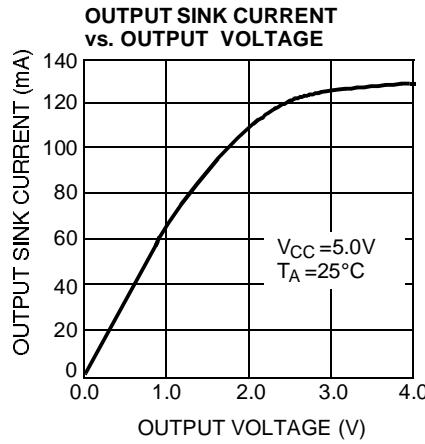

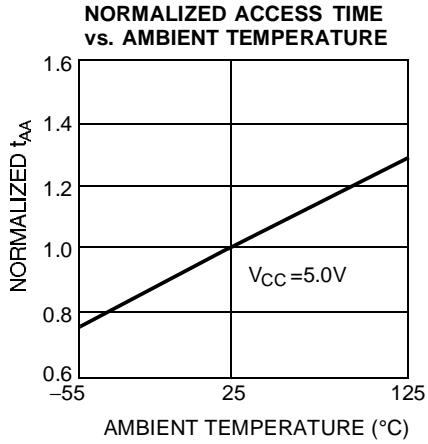

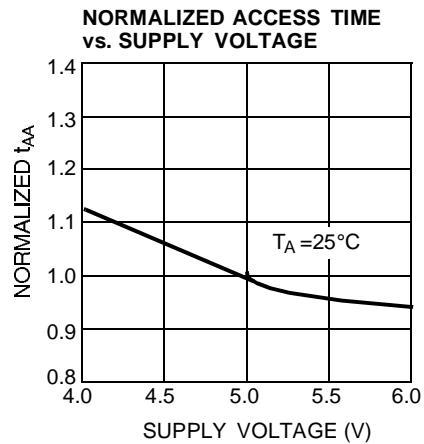

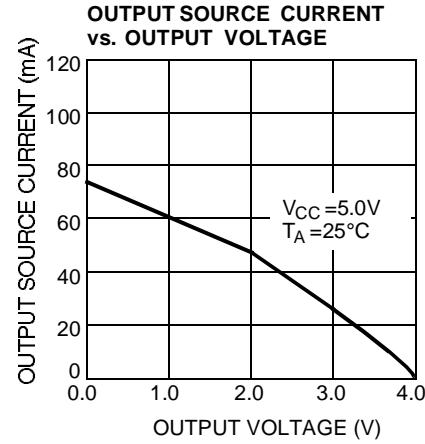

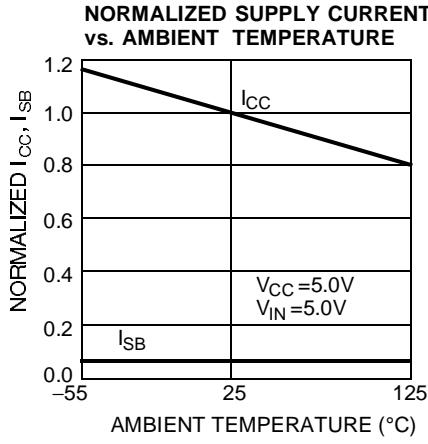

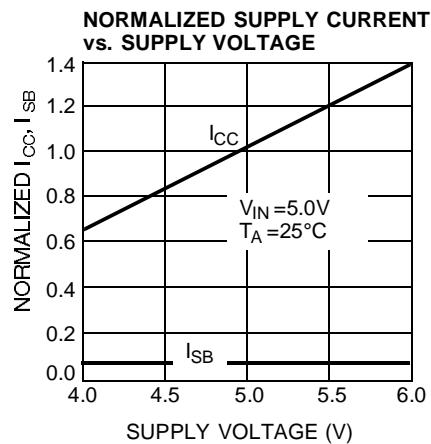

**Notes:**

6. Test conditions assume signal transition times of 5 ns or less, timing reference levels of 1.5V, input pulse levels of 0 to 3.0V, and output loading of the specified  $I_{OL}/I_{OH}$  and 30-pF load capacitance.
7. At any given temperature and voltage condition,  $T_{HZ}$  is less than  $t_{LZ}$  for all devices. Transition is measured  $\pm 500$  mV from steady state voltage with specified loading in part (b) of AC Test Loads and Waveforms.
8. 3-ns minimum for the CY7C169A.
9. t<sub>HZCE</sub> and t<sub>HZWE</sub> are tested with  $C_L = 5$  pF as in part (a) of Test Loads and Waveforms. Transition is measured  $\pm 500$  mV from steady state voltage.
10. The internal write time of the memory is defined by the overlap of CE LOW and WE LOW. Both signal must be LOW to initiate a write and either signal can terminate a write by going high. The data input setup and hold timing should be referenced to the rising edge of the signal that terminates the write.
11. WE is HIGH for read cycle.
12. Device is continuously selected, CE = V<sub>IL</sub>.

**Switching Waveforms (Continued)**
**Read Cycle<sup>[11,13]</sup>**

**Write Cycle No. 1 (WE Controlled)<sup>[10]</sup>**

**Write Cycle No. 2 (CS Controlled)<sup>[10,14]</sup>**

**Notes:**

13. Address valid prior to or coincident with  $\overline{CE}$  transition low.
14. If  $CE$  goes HIGH simultaneously with  $WE$  HIGH, the output remains in a high-impedance state.
