

64K (8K x 8) CMOS EPROM

FEATURES

- High speed performance
 - 120 ns access time available
- CMOS Technology for low power consumption
 - 20 mA Active current
 - 100 μ A Standby current
- Factory programming available
- Auto-insertion-compatible plastic packages
- Auto ID aids automated programming
- Separate chip enable and output enable controls
- High speed "express" programming algorithm
- Organized 8K x 8: JEDEC standard pinouts
 - 28-pin Dual-in-line package
 - 32-pin PLCC Package
 - 28-pin SOIC package
 - Tape and reel
- Available for the following temperature ranges
 - Commercial: 0°C to +70°C
 - Industrial: -40°C to +85°C

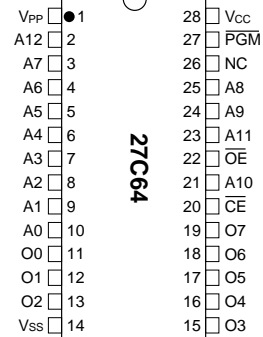

DESCRIPTION

The Microchip Technology Inc. 27C64 is a CMOS 64K bit (electrically) Programmable Read Only Memory. The device is organized as 8K words by 8 bits (8K bytes). Accessing individual bytes from an address transition or from power-up (chip enable pin going low) is accomplished in less than 120 ns. CMOS design and processing enables this part to be used in systems where reduced power consumption and high reliability are requirements.

A complete family of packages is offered to provide the most flexibility in applications. For surface mount applications, PLCC or SOIC packaging is available. Tape and reel packaging is also available for PLCC or SOIC packages.

PACKAGE TYPES

DIP/SOIC

PLCC

1.0 ELECTRICAL CHARACTERISTICS

1.1 Maximum Ratings*

VCC and input voltages w.r.t. VSS -0.6V to + 7.25V
 VPP voltage w.r.t. VSS during programming -0.6V to +14V
 Voltage on A9 w.r.t. VSS -0.6V to +13.5V
 Output voltage w.r.t. VSS -0.6V to VCC +1.0V
 Storage temperature -65°C to +150°C
 Ambient temp. with power applied -65°C to +125°C

*Notice: Stresses above those listed under "Maximum Ratings" may cause permanent damage to the device. This is a stress rating only and functional operation of the device at those or any other conditions above those indicated in the operation listings of this specification is not implied. Exposure to maximum rating conditions for extended periods may affect device reliability.

TABLE 1-1: PIN FUNCTION TABLE

Name	Function
A0-A12	Address Inputs
\overline{CE}	Chip Enable
\overline{OE}	Output Enable
\overline{PGM}	Program Enable
VPP	Programming Voltage
O0 - O7	Data Output
VCC	+5V Power Supply
VSS	Ground
NC	No Connection; No Internal Connections
NU	Not Used; No External Connection Is Allowed

TABLE 1-2: READ OPERATION DC CHARACTERISTICS

VCC = +5V (±10%) Commercial: Tamb = 0°C to +70°C Industrial: Tamb = -40°C to +85°C

X = Don't Care

1.2 Read Mode

(See Timing Diagrams and AC Characteristics)

Read Mode is accessed when

- the \overline{CE} pin is low to power up (enable) the chip
- the \overline{OE} pin is low to gate the data to the output pins

For Read operations, if the addresses are stable, the address access time (t_{ACC}) is equal to the delay from \overline{CE} to output (t_{CE}). Data is transferred to the output after a delay from the falling edge of \overline{OE} (t_{OE}).

1.3 Standby Mode

The standby mode is defined when the \overline{CE} pin is high (VIH) and a program mode is not defined.

When these conditions are met, the supply current will drop from 20 mA to 100 μ A.

1.4 Output Enable

This feature eliminates bus contention in microprocessor-based systems in which multiple devices may drive the bus. The outputs go into a high impedance state when the following condition is true:

- The \overline{OE} and \overline{PGM} pins are both high.

1.5 Erase Mode (U.V. Windowed Versions)

Windowed products offer the capability to erase the memory array. The memory matrix is erased to the all 1's state when exposed to ultraviolet light. To ensure complete erasure, a dose of 15 watt-second/cm² is required. This means that the device window must be placed within one inch and directly underneath an ultraviolet lamp with a wavelength of 2537 Angstroms, intensity of 12,000 μ W/cm² for approximately 20 minutes.

1.6 Programming Mode

The Express Algorithm has been developed to improve the programming throughput times in a production environment. Up to ten 100-microsecond pulses are applied until the byte is verified. No overprogramming is required. A flowchart of the express algorithm is shown in Figure 1-3.

Programming takes place when:

- VCC is brought to the proper voltage,
- VPP is brought to the proper VH level,
- the \overline{CE} pin is low,
- the \overline{OE} pin is high, and
- the \overline{PGM} pin is low.

Since the erased state is "1" in the array, programming of "0" is required. The address to be programmed is set via pins A0-A12 and the data to be programmed is presented to pins O0-O7. When data and address are stable, \overline{OE} is high, \overline{CE} is low and a low-going pulse on the \overline{PGM} line programs that location.

1.7 Verify

After the array has been programmed it must be verified to ensure all the bits have been correctly programmed. This mode is entered when all the following conditions are met:

- VCC is at the proper level,
- VPP is at the proper VH level,
- the \overline{CE} line is low,
- the \overline{PGM} line is high, and
- the \overline{OE} line is low.

1.8 Inhibit

When programming multiple devices in parallel with different data, only \overline{CE} or \overline{PGM} need be under separate control to each device. By pulsing the \overline{CE} or \overline{PGM} line low on a particular device in conjunction with the \overline{PGM} or \overline{CE} line low, that device will be programmed; all other devices with \overline{CE} or \overline{PGM} held high will not be programmed with the data, although address and data will be available on their input pins (i.e., when a high level is present on \overline{CE} or \overline{PGM}); and the device is inhibited from programming.

1.9 Identity Mode

In this mode, specific data is output which identifies the manufacturer as Microchip Technology Inc. and device type. This mode is entered when Pin A9 is taken to VH (11.5V to 12.5V). The \overline{CE} and \overline{OE} lines must be at VIL. A0 is used to access any of the two non-erasable bytes whose data appears on O0 through O7.

Pin \rightarrow	Input	Output								
Identity \downarrow	A0	0 7	0 6	0 5	0 4	0 3	0 2	0 1	0 0	H e x
Manufacturer	VIL	0	0	1	0	1	0	0	1	29
Device Type*	VIH	0	0	0	0	0	0	1	0	02

* Code subject to change
