DESCRIPTION

The LM346 consists of four independent, high gain, internally compensated, low power programmable amplifiers. Two external resistors (R_{set}) allow the user to program the gain-bandwidth product, slew rate, supply current, input bias current, input offset current and input noise. For example the user can trade-off supply current for bandwidth or optimize noise figure for a given source resistance. In a similar way other amplifier characteristics can be tailored to the application.

Except for the two programming pins at the end of the package the LM346 pin out is the same as the LM324 and LM348.

PROGRAMMING EQUATIONS :

Total supply current = 1mA ($I_{set} = 10\mu A$)

Gain bandwidth product = 1MHz ($I_{set} = 10\mu A$)

Slew rate = 0.5V/µs ($I_{set} = 10\mu A$)

Input bias current $\approx 30nA$ ($I_{set} = 10\mu A$)

I_{set} = current into pin 8 and pin 9 (see schematic diagram)

$$I_{set} = \frac{V_{cc+} - V_{cc-} - 0.6V}{R_{set}}$$

- For supply voltage less than $\pm 15\text{V}$, the absolute maximum input voltage is equal to the supply voltage.
- Any of the amplifier outputs can be shorted to ground indefinitely; however more than one should not be simultaneously shorted as the maximum junction will be exceeded.
